

Can you rewrite create_new_args as a two lines of code using functional programming, list comprehensions, and shortcuts? How about a single line?

```
def create_new_args_2(args):  
    max_len = max(len(x) for x in args if isinstance(x, list))  
    return [a if isinstance(a, list) and len(a) == max_len else [a]*max_len for a in args] if all(isinstance(a, list) and len(a) == max_len f
```

```
create_new_args_1([[1,2],[3,4],5])
```

```
→ [[1, 2], [3, 4], [5, 5]]
```

```
create_new_args_2([[1,2],[3,4],5])
```

```
→ [[1, 2], [3, 4], [5, 5]]
```
